## CONTENTS

1. INSTALLATION AND SERVICE ADJUSTMENTS
2. TELEVISION ALIGNMENT PROCEDURE
  - 2.1. PICTURE IF TRANSFORMER AND TRAP ALIGNMENT
  - 2.2. VIDEO ALIGNMENT AND SOUND ALIGNMENT
3. MAIN PARTS LOCATION (CHASSIS TOP VIEW)
4. CABINET CONSTRUCTION AND PARTS LIST
5. CHASSIS REPAIR PARTS LIST
6. SCHEMATIC DIAGRAM
7. PRINTED CIRCUITS BOARD PW711

## SPECIFICATIONS

ANTENNA INPUT IMPEDANCE	300 ohm balanced
FOCUS	Electrostatic
INTERMEDIATE FREQUENCIES	
Picture IF Carrier Frequency	38.9 MHz
Sound IF Carrier Frequency	33.4 MHz
PICTURE SIZE	Approx. 75 sq. inch on a 310DMB4
POWER INPUT RATING	25 watts, 220 volts, AC, 50 Hz 12 watts, 12 volts, DC
TELEVISION RF FREQUENCY RANGE	
Any of 11 VHF channels	47-70 MHz (Channels 2-4) 173-230 MHz (Channels 5-12)
Any of 48 UHF channels	460-853 MHz (Channels 21-68)

## 1 INSTALLATION AND SERVICE ADJUSTMENTS

### IMPORTANT NOTICE FOR SERVICE PERSONNEL BEFORE SERVICING

READ THE FOLLOWING NOTES BEFORE ATTEMPTING TO TEST OR SERVICE THIS RECEIVER.

SINCE THIS IS A TRANSISTORIZED SET, CARE MUST BE TAKEN TO PREVENT THE TRANSISTORS FROM OVERLOADING WHICH WILL CAUSE PREMATURE FAILURE.

1. The DC voltage at Q901 emitter is  $12.0 \pm 0.3$  volts, when AC 220 volts is supplied to the set.
2. When servicing, watch AC power line voltage so that it does not exceed 240 volts.
3. When making adjustment of deflection circuit including horizontal frequency adjustment described on page 2 of this sheet, AC line voltage must be kept at 220 volts.
4. When varying horizontal frequency, do not deviate more than 200 hertz from the rated center frequency 15.625 KHz.
5. Do not discharge, arc or meter second anode lead of the picture tube and high voltage circuit for protection of transistors within the set. Disconnect the lead and discharge the anode only and not the lead, if required.
6. While the receiver is in operation, do not attempt to disconnect the lead wires.
7. When replacing the parts in the receiver, make sure the power supply cord is disconnected first.
8. When the power is on, do not attempt to short any portion of the circuits at all. This shorting may cause damage to the transistors within the set.

#### FOCUS

Focus lead (Orange) from Pin 7 of the picture tube socket is soldered to Pin 6 (100V) of the same socket at factory.

If Focus adjustment is required, unsolder the lead from Pin 6 (100V) and solder it to Pin 4 of the socket. (Ground)

#### DEFLECTION YOKE AND CENTERING RINGS

1. Turn the receiver on and connect the antenna.
2. Loosen the Deflection Yoke clamp, and carefully move the yoke on the neck of the picture tube as far forward as possible.
3. Rotate the yoke until the top and bottom edges of the raster are squared. Tighten the clamp.
4. Center the raster and eliminate shaded corners. Rotate the centering rings until the best effect is obtained.

#### VERTICAL HEIGHT

1. Set the Height control (R314) to mid-position.
2. Adjust the Vertical Linearity control (R321) to obtain the best linearity.
3. Adjust the Height control to obtain proper picture height.

#### HORIZONTAL FREQUENCY

1. Tune in an active channel.
2. Turn Horizontal Hold control (T401) to sync picture.
3. Make sure that picture goes out of sync when the selector is switched to another channel momentarily, back to original channel.

#### TUNER

If the range of Fine tuning control is not adequate to tune in a clear picture on one or more channels, oscillator cores must be adjusted.

1. Set the flatly cutted face of fine tuning shaft in a quarter angle with the face of terminal of tuner.
2. Adjust oscillator core with non-metallic aligner to obtain best picture, starting from higher channel down to lower. Do not press the core too hard during adjustment.

## 2 TELEVISION ALIGNMENT PROCEDURE

#### PRELIMINARY

Alignment is an exacting procedure and should be undertaken only when necessary. The following equipment is required for alignment work.

1. RF sweep generator, with a frequency range covering VHF all channels with a sweep width of at least 10MHz and having an adjustable output of at least 0.1 volt.
2. RF Marker, with an output of at least 0.1 volt having frequency range to cover VHF channel.
3. PIF Marker, with an output of at least 0.1 volt having frequency range to cover 40.4 MHz, 38.9 MHz, 37.9 MHz, 36.9 MHz, 35.9 MHz, 34.9 MHz, 33.4 MHz, 31.9 MHz.
4. Vacuum Tube Voltmeter (VTVM).
5. Cathode Ray Oscilloscope, preferable with a wide frequency range vertical amplifier and voltage calibrator.

## 2.1 PICTURE IF TRANSFORMER AND TRAP ALIGNMENT

### 1. Test Equipment Connection (See Fig. 1)

Bias Supply ..... Remove white lead wire jumper connected to the bottom view of the PRINTED CIRCUIT BOARD PW711.  
 Supply the external AGC voltage (approx 2.5 volt) to the terminal TP102.

RF Sweep Generator ..... Connect to the VHF antenna terminal (P102)

RF Marker ..... Couple loosely to sweep generator output lead to provide markers.

PIF Marker ..... Couple loosely to Tuner output lead to provide markers.

Oscilloscope ..... Connect to video detector output, at the TP101 in series with 10K-30Kohm resistor.

Turn Channel selector to non active channel and set Fine tuning to suitable position.

### 2. Alignment

Step	Signal Generator	Adjust	Remark
1 Adjust 31.9 MHz Trap	31.9 MHz	L103	Adjust for minimum output of 31.9 MHz
2 Adjust 33.4 MHz Trap	33.6 MHz	L101	Adjust for minimum output of 33.6 MHz
3 Adjust 40.4 MHz Trap	40.4 MHz	L102	Adjust for minimum output at 40.4 MHz
4 Adjust Picture IF Band Pass Response (See Fig. 2)	37 MHz	PIFIA T101, T103	Adjust for the response curve show in Fig. 2
			During the alignment adjust the output of sweep generator, the waveform on oscilloscope does not exceed 1Vss.

## 2.2 VIDEO ALIGNMENT AND SOUND ALIGNMENT

### 1. Test Equipment Connections: (See Fig. 3)

Bias Supply ..... Supply the external AGC voltage (Approx. 4. volts) to the terminal TP102.

Signal Generator ..... Connect to TP101 in series with 10  $\mu$ fd capacitor and 3.3 Kohm resistor.

### 2. Alignment

Step	Signal Generator	Adjust	Remarks
Connect VTVM to CRT Cathode Pin 2 and chassis ground.			
Adjust 5.5 MHz Trap Coil	5.5 MHz	L201	Remove one end of C311 and C417 on the PRINTED CIRCUIT BOARD PW711. Adjust the contrast control (R215) to maximum set generator output approx. 100mV. Adjust L201 for minimum output indication on the VTVM connected to CRT pin 2.
Connect VTVM between TP601 and chassis. (See Fig. 3)			
Adjust SIF 1 SIF 2	5.5 MHz 3mV	SIF 1 SIF 2	Turn SIF1, SIF 2A SIF 2B for maximum output indication on the VTVM.
Connect between TP601 and chassis in series with two 100K $\Omega$ resistor, and connect VTVM between its center and TP602. (See Fig 3)			
Adjust SIF 2B	5.5 MHz 30mV	SIF 2B	Adjust SIF 2B for 0 volt indication on the VTVM.

## 6. SCHEMATIC DIAGRAM

### NOTES:

1. All resistance values are in ohm K=1,000, M=1,000,000.
2. Unless otherwise noted in schematic diagram, all capacitors values less than 1 are expressed in  $\mu$ fd and the more than 1 are in pfd.
3. Voltage readings are taken with "VTVM" from point indicated to chassis ground, tuner unused channel, contrast at maximum, other controls at normal, line voltage 220 volts. Voltage readings may vary  $\pm 20\%$ .
4. All wave forms are measured with strong signal input, contrast set to give normal picture.
5. This schematic diagram covers basic or representative chassis only. There may be some component or partial schematic difference between actual chassis and the schematic diagram.
